

Code completion

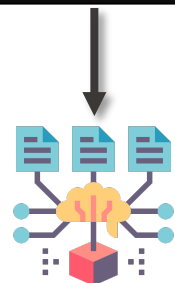

```
import bs4
import requests
import re

def task_func(url: str, output_path: str) -> list:
    """
    Extracts phone numbers to a specified file.

    Parameters:
    ..

    Returns:
    - list: A list of strings.

    Requirements:
    ....
```

LLM

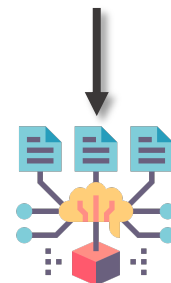

```
if url.startswith("file:///"):
    with open(url[7:], 'r') as file:
```

Code Infilling (Fill in the Middle)

```
from typing import List

def has_close_elements(numbers, threshold):
    """
    Check are any two numbers closer to each
    other than threshold.
    """
    for idx, elem in enumerate(numbers):
        for idx2, elem2 in enumerate(numbers):
            if idx != idx2:
                <Fill in the Middle>
                if distance < threshold:
                    return True

    return False
```

LLM

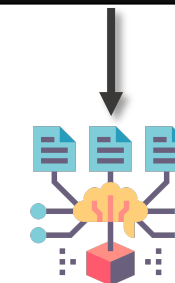

```
distance = abs(elem - elem2)
```

Instruction Following

Problem:
I want to figure out how to remove nan values from my array.
For example, My array looks something like this:
x = [1400, 1500, 1600, nan, nan, nan ,1700] #Not in this exact configuration
How can I remove the nan values from x to get sth like:
x = [1400, 1500, 1600, 1700]

Answer:

```
import numpy as np
x = np.array([1400, 1500, np.nan ,1700])
</code>
x = ... # put solution in this variable
BEGIN SOLUTION
<code>
```

LLM

Certainly! Here is the answer for the question: x =
x[~np.isnan(x)]
